Some questions:

- Have you ever been involved in a project that was completed late?
- Have you ever been delayed by someone else not providing you the input you needed?
- Has anyone expected you to provide something without letting you know?
- Have you ever had a beneficial suggestion, but no means of demonstrating its value?

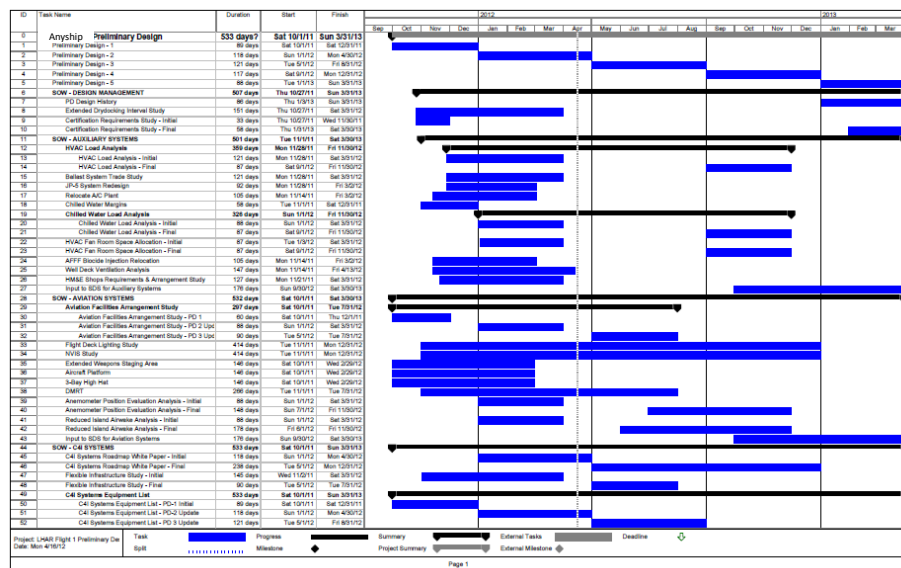

Notice:
Bad planning
on your part
does not
constitute an
emergency
on my part.

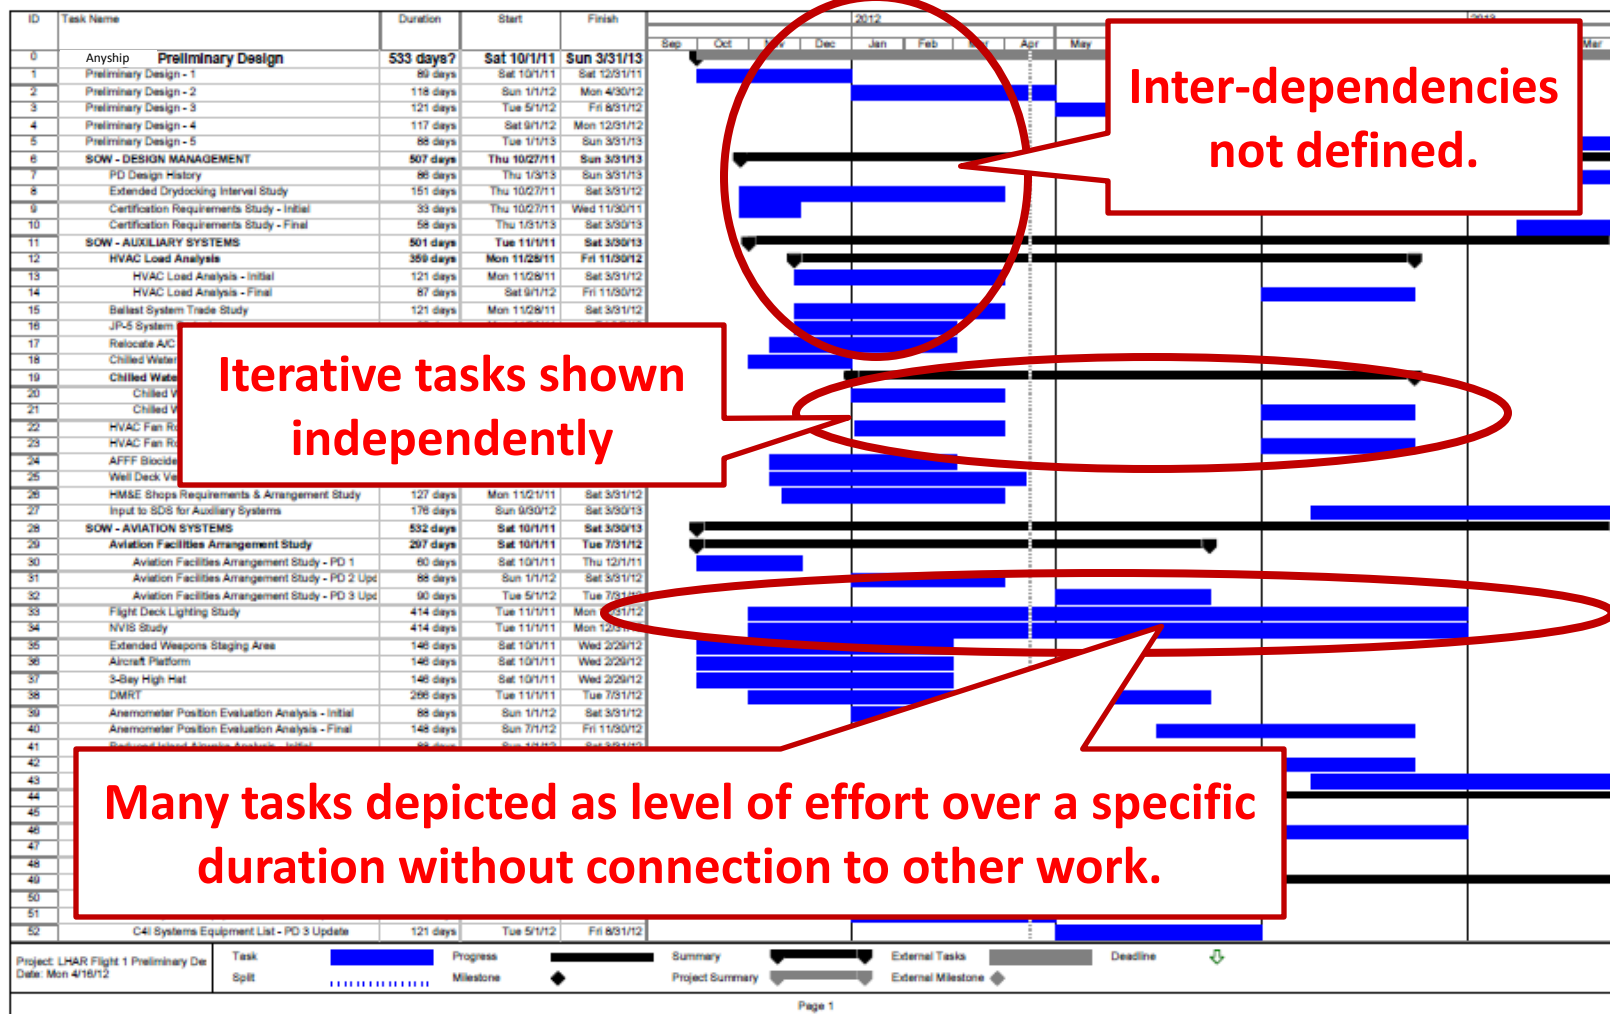

Typical Preliminary Design Schedule

- Tasks described in Microsoft Project®
- Collocated HM&E resources (to extent possible)
- Multiple Commands involved
 - Aviation Systems
 - Combat Systems
 - Integrated Warfare Systems

Level of Effort vs. Detailed Process

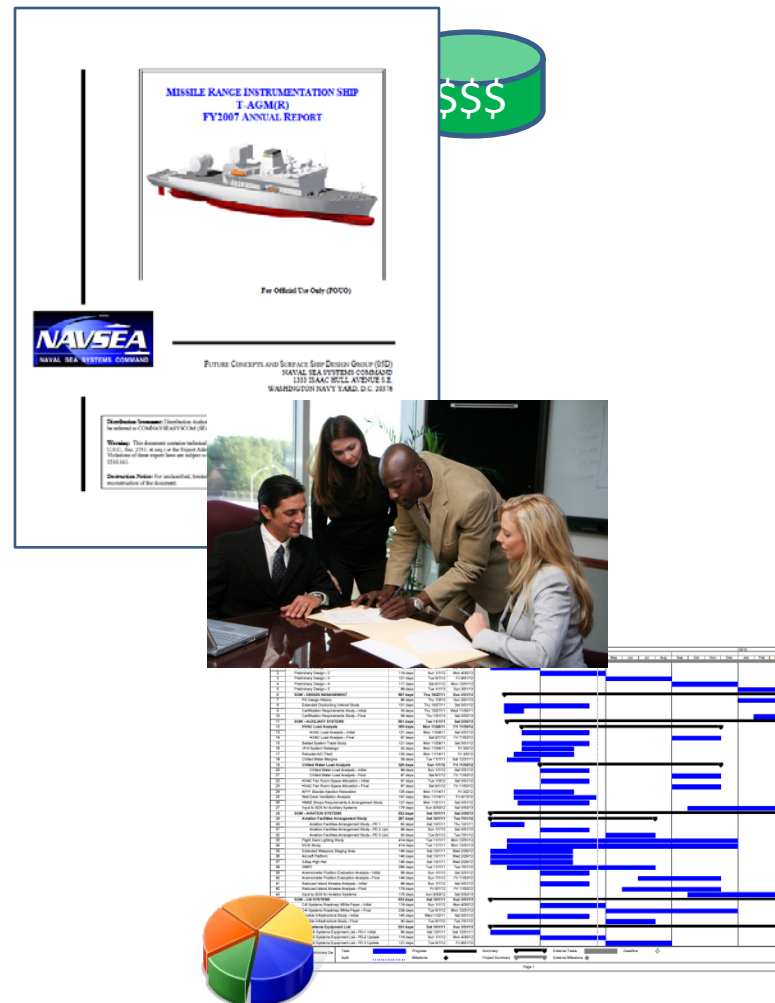

Dynamic Management

- Requirements and Program Office direction can change.
- Weekly stand-up meetings provide this week's priorities and "30 day look" (cadence.)
- The on-site team is cohesive; remote team elements may be less well integrated.
- Design Reviews are key to integration; solutions to issues examined in next cycle.
- Success is function of Ship Design Manager (SDM) skill and intuition.

Organizational Wisdom

- Schedules are based on the experience of the community and leadership expertise.
- Past practice is captured in “Red Books” and Annual Reports.
- Technical Warrant Holder community provides domain expertise.
- Emphasis is on budget allocation.

Opportunity

- Navy budgets increasingly constrained.
- Ship design community decimated.
- Systems becoming more complex.
- Engineering and planning processes consume approximately one third of life cycle costs. (~\$13B/yr)
- Scheduling with time-trusted techniques can cause:
 - Unnecessary work
 - Delays
 - Engineering errors; missing data

**Can we do
better?
*Yes, we can!***

The Ship Design Process Model

- Since 2008 the Navy has been developing a model of the ship design process.
- Initial objective was to quantify the benefits of new software.
- The team has identified some new tools and techniques that help us capture the expertise of the community and apply it towards effective project planning.
- The Technical Warrant Holder Community has contributed its expertise.
- We are in the pilot stage on real acquisition programs to validate anticipated benefits.

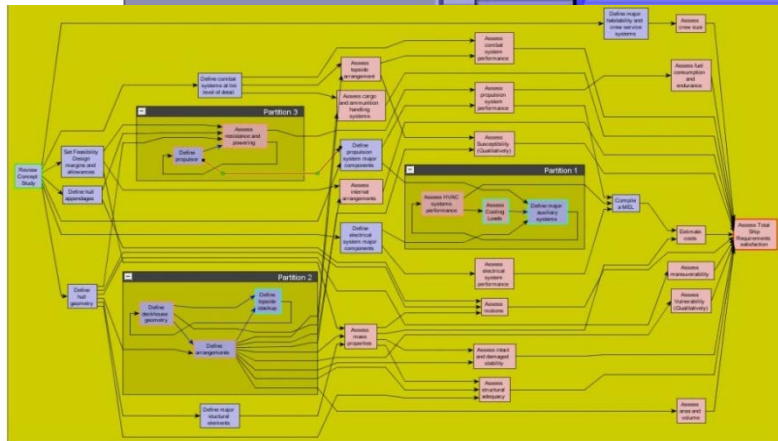

Data-Centric Approach

- The Ship Design Process Model (SDPM) is a database that captures the activities and transactions within the ship design process.
- The Ship Design Process Reference Model (SDPRM) represents a typical surface combatant design process.
- The SDPRM data was gathered primarily during the ONR Ship Design Workshops.
- The SDPRM is a starting point for planning other ship design processes; unique models generated.
- The SDPRM includes a representative range of activities and reminds the SDM of activities to consider when planning a new project, of any type.
- Commercial software enables rapid editing to tailor the process and supports simulations to explore alternatives.

The SDPRM has been modeled using the PLEXUS® software from Plexus Planning, Ltd. This commercial product has proven to be intuitive and capable of meeting our modeling needs. Used by Rolls Royce, GE, Boeing, & Raytheon.

Design Structure Matrix

Process Data

- The SDPM captures data on activities and their interdependence.
- The SDPM clearly defines inter-organizational relationships and responsibilities.
- Activity data can include the typical content of tasking statements such as:
 - Organizational Assignments
 - Expected Deliverables
 - Resources Required
 - Expected Duration
 - User-defined data

Process Data

Assess Architecture and Design at Engagement Level against Require...

Name
Assess Architecture and Design at Engagement Level against Requirements

Activity Type: Activity Activity Status: ? <None>

Duration: 11 Duration Unit: months

Resources Groups Requests Constraints & Cost Schedule
Extra Fields Description Decisions Duration Audit Legend

Needs to capture cost and risk, technology maturity
Fidelity of models may increase as design maturity progresses.
May include, but not limited to:
Mission Effectiveness,
Safety,
Manning,
Cost,
Environmental Considerations,
Risk,
Interoperability,
Logistics,
everything enumerated as an ASPEC
initial modeling of software architecture, computing performance, and human performance
Human Systems Integration

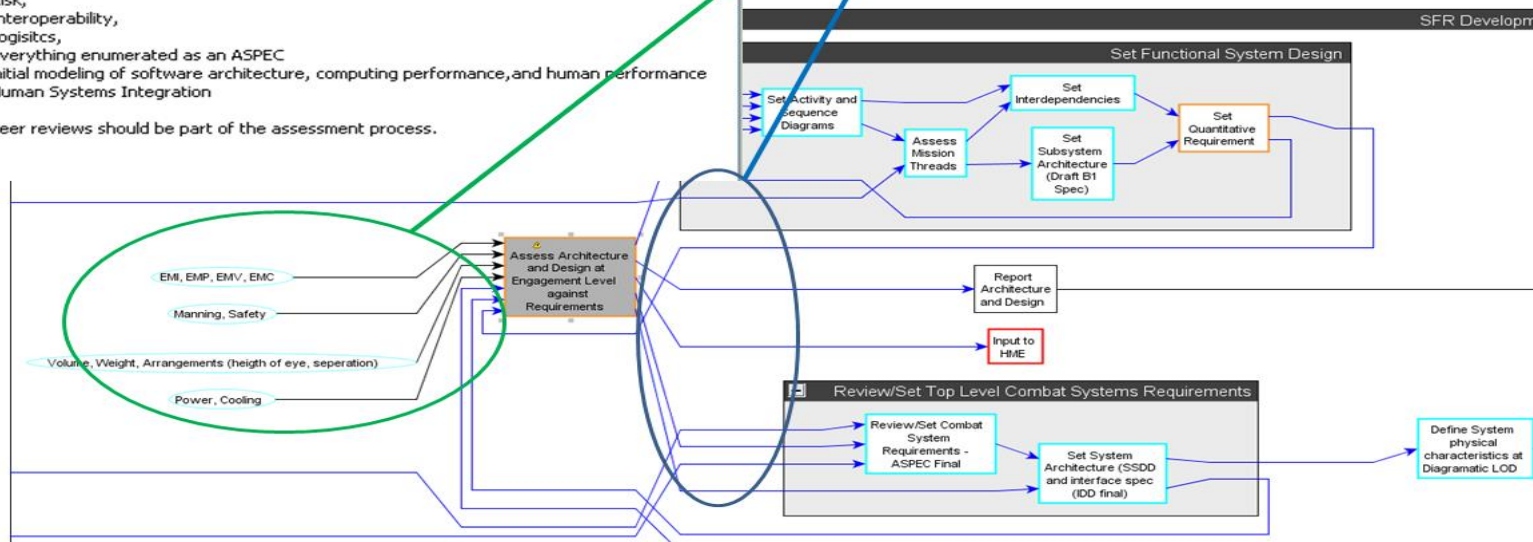

Peer reviews should be part of the assessment process.

Activity - Assess Architecture and Design at Engagement Level against Requirements

Information contained in Activity

Information Inputs

Information Outputs

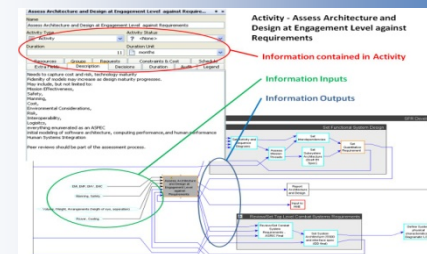

SDPRM Business Processes

1. SDM consults process model library to begin planning process.

2. Process visualization, rapid assessment of alternatives, and optimization.

3. Data captured regarding team commitments and dependencies.

6. Actual results imported back in to the model.

5. Program management

4. Preferred process exported to MS Project.

SDPRM Applications

Summary

1. The ship acquisition community spends \$Billions per year on engineering and planning processes.
2. Contemporary modeling tools and techniques are available to understand and assess processes.
3. Effective process execution requires the processes to be defined.
4. Process improvement requires well defined processes.
5. Process modeling supports training.

The SDPRM enables more effective ship design management - *leading to a more cost effective Fleet.*
