#### PURDUE NIVERSITY

## **Research Questions**

- How do system-specific characteristics impact the successful development of systems of systems for capability-based acquisition?
- How do system interdependencies impact the development process?
  - How do <u>disruptions propagate</u> in complex networks of interdependent systems?
  - How can we quantify the <u>cascading effects</u> of development risk?
- <u>Objective</u>: Answers to these questions can increase the probability of success in systems of systems development

## **Methods of Approach**

- Simulation Approach
  - Developing Computational Exploratory Model (CEM)
  - Discrete-event, stochastic simulation based on steps in DoD SoS SE Guide
- Analytical Approach
  - Based on probability and network theory
  - Analysis of expected delay propagation for arbitrary SoS network configurations

#### CEM Development via NPS Acquisition Research Program Grants ('08-present)

School of Aeronautics and Astronautics

PURDUE

### **Current Research Efforts**

- System risk (*R*<sub>sys</sub>) as a function of system readiness-level (*m*)
  - Similar to TRL metric and SRL metric proposed by Sauser et al.
- SoS risk a function of system risk and topology and strength of system interdependencies
  - Disruptions propagate to dependent systems
  - Cascading effects of disruptions captured

## **System Risk and Interdependencies**

 Candidate families of systems can have different combinations of systemrisk and interdependency strengths

School of Aeronautics and Astronautics

These characteristics have different impact on development success

## **PURDUE**

## **Comparison of Alternatives**

- What effect does the number of systems and interdependencies have on development time?
  - If candidate systems can provide same capability-level, which one should be favored?

## **Observations**

- Five-system SoS has largest completion time (regardless of dependency strength)
  - Different dependency strengths can still lead to faster development
- Number of systems and systemrisk alone insufficient to describe the risk profile of a SoS
  - Strength of interdependencies is important network characteristic

## **PURDUE**

## **Reflections on CEM**

- Exploratory model helps identify markers of failure and success
- Understand the system dynamics so that a motivator for PMs is identified
- Understand cascading effects of risk and requirement changes

#### Balancing Capability Potential and Risk Among Alternatives

- Added rudimentary capability estimation to the CEM
- Enable tradeoff studies between capability and development time
- Examines a Pareto frontier for alternate configurations of an Airborne Laser Platform used in missile defense applications

## **Analytical Approach**

- Based on network and probability theory
- Capture and quantify the cascading effect of risk
  - Delay propagation as a metric for comparing the performance of SoS networks
- Enable the design of networks that reduce (minimize) impact of risk

## **PURDUE**

## **Ongoing/Future Work**

- Analytical model for delay propagation
- Capability-module
- Tradeoff between development time and capability
- Dynamic time-scales
- Ongoing data search to test the CEM
