

# Model-based Approach in Defense Portfolio Management: Data Preparation, Analysis, and Visualization of Decision Spaces

20th Annual Acquisition Research Symposium  
Naval Postgraduate School

Presented by Dr. Cesare Guariniello and Dr. Waterloo Tsutsui

Coauthors: Dr. Kshitij Mall, Dr. Frank Patterson, Dr. Santiago Balestrini-Robinson, Dr. Jitesh Panchal, and Dr. Daniel DeLaurentis

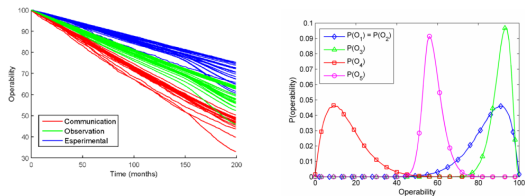

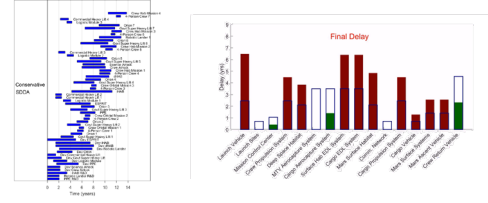

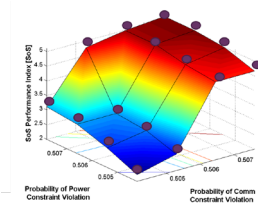

# Acknowledgment

The author acknowledges financial support from the U.S. Department of Defense through SERC/AIRC on research task WRT 1049.5, contract no. HQ0034-19-D-0003 and report no. AIRC-2022-TR-007.

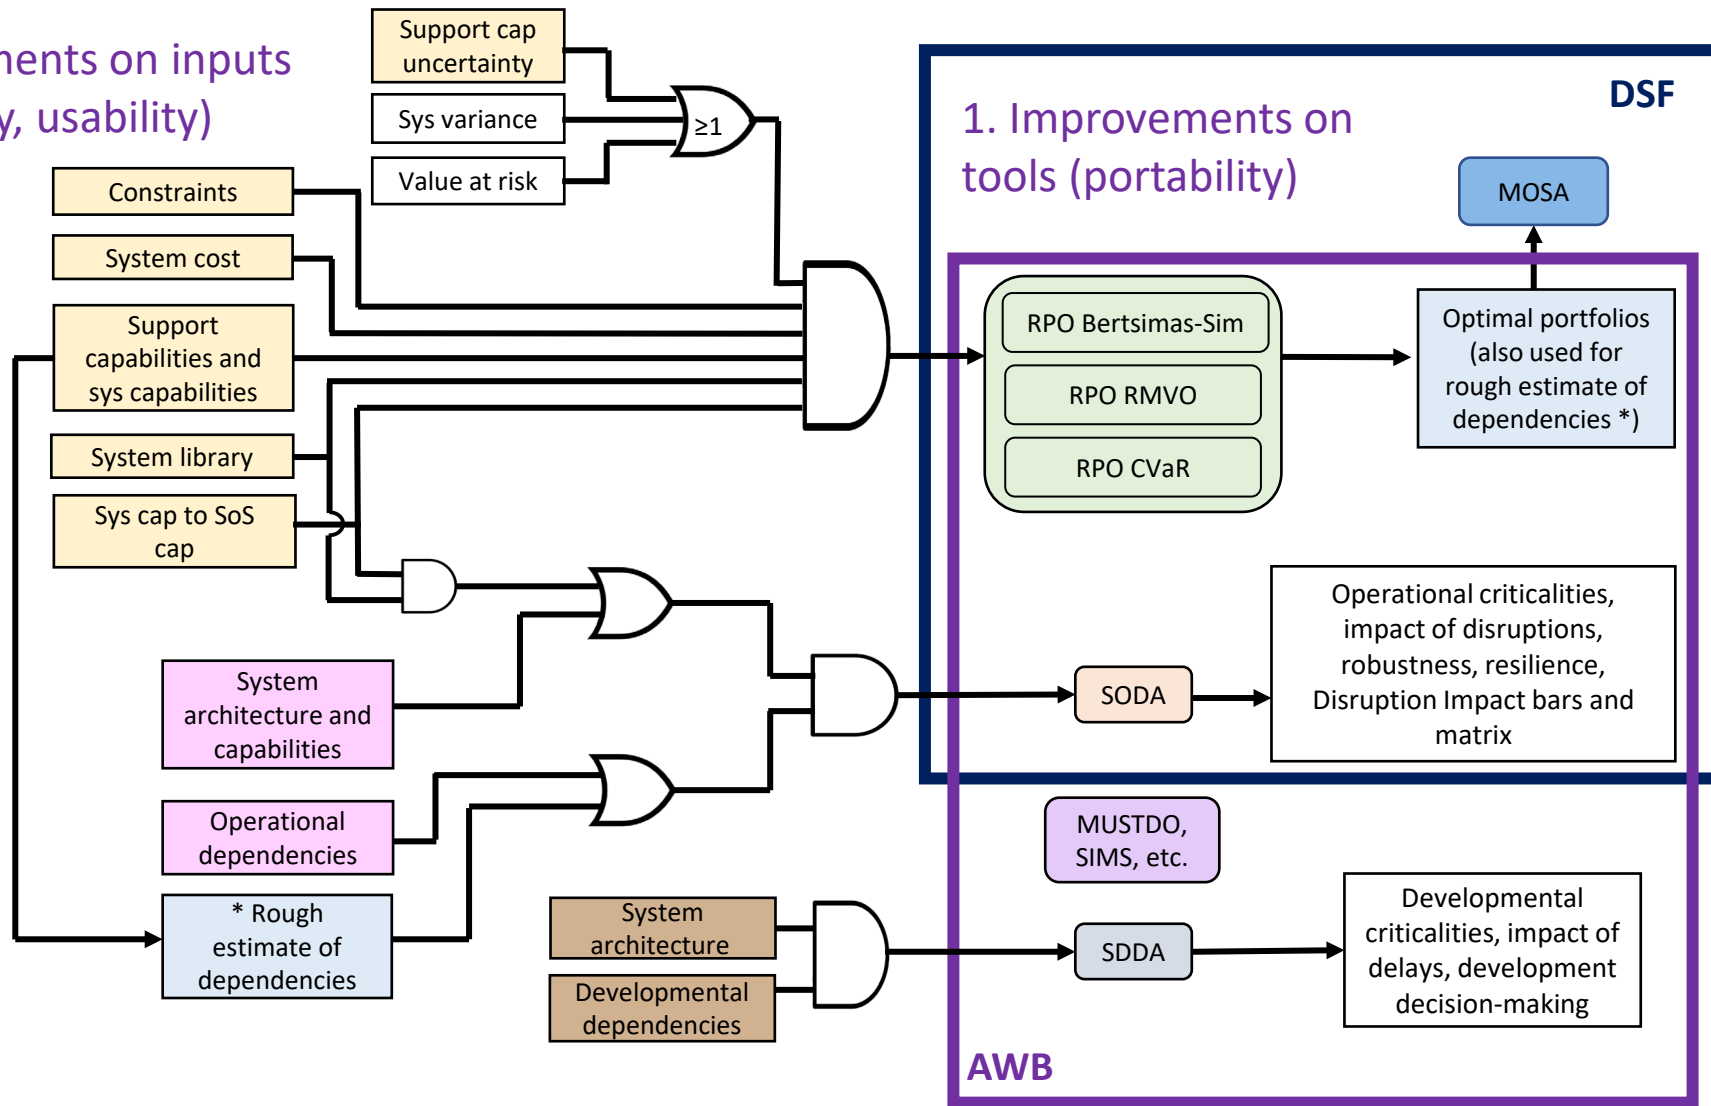

# Research Question and Issues

- **Question:** How can we develop prototype tools to enhance data-driven decision-making for the DoD's Integrated Acquisition Portfolio Review (IAPR) process?
  - Utilize the portfolio-centric approach
  - Enhance and adapt an existing research product called the System-of-Systems Analytic Workbench (AWB), which consists of various tools

<p style="text-align: center;"><b>System Operational Dependency Analysis (SODA)</b></p> <ul style="list-style-type: none"> <li>• Which systems are critical to SoS performance?</li> <li>• What is the impact of system failures during operations?</li> </ul> 	<p style="text-align: center;"><b>System Developmental Dependency Analysis (SDDA)</b></p> <ul style="list-style-type: none"> <li>• What is the impact of delays?</li> <li>• Which technologies need to be prioritized?</li> </ul> 
<p style="text-align: center;"><b>Robust Portfolio Optimization (RPO)</b></p> <ul style="list-style-type: none"> <li>• Treat SoS as a portfolio of systems</li> <li>• Mathematical programming to identify best portfolio</li> </ul> 	<p style="text-align: center;"><b>Multi-Stakeholder Dynamic Optimization (MUSTDO)</b></p> <ul style="list-style-type: none"> <li>• How do we coordinate planning between local and SoS-level stakeholders?</li> </ul> 

# Prototype Tools I/O and relationships

## 2. Improvements on inputs (extensibility, usability)

# Research Methodology

## **AWB interoperability, extensibility, and usability upgrades:**

- RPO
  - Migrate RPO to a fully Python-based application (previously, MATLAB license required)
  - Provide I/O data control and validation methods
  - Integrate RPO into a controlled Python product with available pip and Anaconda packages
  - Add unit and integration testing, static code analysis, and implementation of CI/CD
  - Convert the input for RPO into compact JavaScript Object Notation (JSON) file (previously, MS Excel)
  - Provide interactive interface for I/O using Jupyter Notebooks
- SODA
  - Integrate SODA into a controlled Python product with available pip and Anaconda packages
  - Add unit and integration testing, static code analysis, and implementation of CI/CD
- SDDA
  - Integrate SDDA into a controlled Python product with available pip and Anaconda packages

## **Application**

- Apply a notional anti-surface warfare (ASuW) scenario to demonstrate the application of the prototype tool

# Conclusions and Future Work

- The research team adapted a previously developed SoS-AWB to inform decisions in IAPRs.
  - Improvements in usability and interfaces
  - Adaptation to various inputs
  - Modularization
- These advanced prototypes provide broader insights (e.g., resource tradeoffs, cost-sensitivity analysis, and the most robust ASuW systems to be acquired in specific portfolios) for the stakeholder's decision-making process.
- Future work will improve the tools to identify the following: how risk aversion affects portfolio optimization; technical dependencies among systems; developmental dependencies; and portfolio performance effects from stakeholder decisions.
